

The latest arrival to the Schultz & Larsen family. The Legacy is a beautiful baby, slim, light and deadly accurate. This is the perfect frame for the popular .222 Rem and .223 Rem calibres, plus the very interesting .300 Blackout.

Weighing in at just 2.8 kg with a barrel length of 53.5cm and a magazine capacity of 4 + 1, the Legacy will be the favoured choice for an evening walk round. Barrels are screw cut for a sound moderator with a 1/2x20 UNF thread.

The top of the action accepts the strong and light-weight Schultz & Larsen all steel scope mounts, available in a range of diameters and heights. The action is drilled and tapped for those who wish to use an alternative mount (hole spacing is 12.5mm and action radius 15mm).

Just like other rifles in the Schultz & Larsen family, the Legacy has a switch barrel system allowing the barrel to be changed for any other in its calibre group with just a simple wrench. The same bolt is used with all Legacy calibres. The surprisingly low cost of a barrel makes it viable to own a Legacy in all three calibres.

Due to the smaller diameter action, Classic and Victory barrels do not interchange and only barrels designed specifically for the Legacy can be used.

Safety has top priority with all locking parts designed and tested to withstand at least three times normal load. In the case of an overload resulting in a primer blow-out or case rupture, the high pressure gas can escape through holes in the front of the action and on the side of the bolt. This, coupled with the extremely tight fit of the bolt and action, ensures that the shooter is not injured.

The safety catch is three position and locks the bolt and blocks the firing pin. The centre position allows unloading of the rifle whilst the safety is engaged.

Available Calibres

Standard

Calibre	Twist Rate
.222	1 : 10
.223	1 : 10
.223	1 : 12
.300 BLK	1 : 7.5

The .300 Blackout (.300 BLK)

Originally developed for use in the M4 Carbine and approved by SAAMI in January 2011, the .300 AAC* Blackout is based on the .223 case and is capable of throwing a 110 grain bullet at 2,400 ft./sec or a 245 grain bullet at 950 ft./sec. That last is a subsonic load and a bit like throwing a brick, with a similar trajectory. Subsonic loads for the .300 AAC Blackout usually use a bullet weight between 180 and 220 grains. An interesting round, especially now factory loads and brass are available from a number of manufacturers. Customers may want to check on local availability of ammo. Brass is available for those who home load.

*Advanced Armament Corporation

Stock Options

The Legacy stock features a straight comb without a cheek piece and is slim and comfortable whilst being light to carry. The standard stock is good walnut heartwood with a straight and strong grain structure and pleasant colour & tone. Finished with linseed oil as are all Schultz & Larsen stocks. Wood upgrades are available.
